My Philosophy of Education

Children are the future and to ensure that the future is to be a bright one, children need to be nurtured and cared for. They must be shown good ethics and morals as well as shown the joy of knowledge, starting at an early age. To often children are discouraged against learning. Either something is too boring or too hard, which is only a state of mind. If that state of mind could be change then we will have more and more students going to school because they have a thirst for knowledge.

By helping a child solve a math problem or acing a test you help boost their confidence and change their state of mind. No longer is a problem too hard. They realized that they can do it. After their confidence is boosted and they have a better self image of themselves each goal that they set every day after becomes that much more attainable. If all the teachers in the world actually thought this way there would be less and less kids saying they were the first person in their family to graduation high school or get accepted to college. They could stop saying they were the first to attend high school or college, simply because more children (later teenagers) would be more motivated to complete high school and go on the a university or college and get a higher education degree.

If teachers would become teachers for the right reasons (reasons that include wanting to help change the lives of children) we will have a between school system, a better community, and therefore a better society.
